MPS Monarch Push Right Angle

The Monarch Push Right Angle hand control incorporates one of the most popular methods of hand control operation, with an unobtrusive design. Braking and acceleration are applied through mechanical linkage. Simply push the handle forward toward the dash to brake or press it downward toward the drivers lap to accelerate. The hand control's accelerator linkage is discreetly located inside the dash. Accelerator lock out feature can be activated for other drivers.

MPS Push/Pull

The Push/Pull hand control is a simple yet proven design. Braking and acceleration are applied through mechanical linkage. Simply push the handle forward toward the dash to brake or pull it back toward the driver to accelerate. The handle is available in an upright or standard handle configuration.

MPS Push/Rock

The Push/Rock hand control is a favorite among driving evaluators. Braking and acceleration are applied through mechanical linkage. Simply push the upright handle forward toward the dash to brake, or rock it back and downward toward the driver to accelerate. Accelerator lock out feature can be activated for other drivers.

Brake Only

The Brake Only hand control is intended for those who use the foot pedal for acceleration but require hand controlled operation of the brakes. Braking is achieved through mechanical linkage. Simply push the handle forward toward the dash to brake.

Considering a new vehicle down the road?

In most cases MPS controls can be transferred to your new vehicle by a qualified mobility professional.

5 year limited warranty.
